

# Final Project Scenario 1

## Systems Security Management

The Fortune Automotive Group is in the process of designing the computer network for its new Denver, Colorado dealership. Recently at one of the company's Arizona locations, there was a fire in the data center, causing minor damage to the server room. Fortunately, the damage was limited to a corner of the room, damaging only a case full of spare parts and old, archived backup tapes. The incident caused enough of a scare to those using the data center that the company is now wanting to explore options for a true disaster recovery solution to provide business continuity in the event of a real disaster. While the plan is to implement a solution at each data center, the upcoming Denver location will be a good environment to determine the viability of a disaster recovery and business continuity solution.

As the primary team responsible for systems management at the company's corporate office, you should investigate at least two potential solutions to present to management and develop a business continuity plan for management to review.
